## Weather trends and winds of change

While it is certainly true that in the European fruit and vegetable market no year is the same, the past two years have been unusually distinctive. Following a small apple and pear harvest in 2017/18, which left more room for imports from the Southern Hemisphere during the first half of 2018, a super-harvest was expected for 2018/19. This did not transpire, however, because yields were ultimately limited by an unforeseen heatwave in central Europe.

In the meantime, a seemingly never-ending summer in northern and central Europe boosted demand for watermelons, but demand for classic fruits such as apples and bananas declined. Vegetable production, meanwhile, suffered particularly from the lack of rain.

Mega-trends in consumer behaviour, such as convenience and ethical purchasing, look set to continue to be important; and the discussion about sustainable packaging for fresh fruit and vegetables will surely become even more influential. However, price still matters. For that reason, we have dedicated an extra chapter here to the role of discounters in Europe.

Wherever you work in the fresh produce industry, the European Statistics Handbook provides valuable information that can help you make decisions in the most important European markets.

In cooperation with:

Europe's climate is hugely varied, which means it can produce a wide range of products on a large scale, with the notable exception of tropical fruits. The continent's largest vegetable producers are Spain and Italy, which together make up about 42 per cent of total European production, followed by Poland, the Netherlands and France. The majority of Poland's production goes for processing. Tomatoes are the most important product in terms of production volume, followed by onions and carrots. Tomatoes account for around 31 per cent of European vegetable production, although most of this volume is used for processing

Spain and Italy are also the leading fruit-producing nations, followed by Poland, France and Greece. Apples are almost as dominant as tomatoes are for vegetables.

Sources: AMI-informiert.de; Eurostat

GDP Growt 2.4 per cent

However, their share of total fruit production is only 27 per cent and processing is comparatively less prominent. Other major fruits include oranges and easy peelers. Strawberries and other berries are being produced to an increasing extent, although despite being high in value their volumes are not big enough for a place among the top eight fruits.

Despite its strong production potential, the EU also depends on imports of fruit and vegetables. Its trade balance is negative for both, although the deficit for fruit is much larger - this is because bananas and other tropical fruits are only produced in minor quantities in the EU.

The vegetable trade is concentrated on product flows between the EU countries. Only around 13 per cent of vegetable imports come from third countries. The most important source of vegetables outside the EU is Morocco, followed by Israel and Egypt. Within the EU, Spain and the Netherlands are the main sources. Germany, France and the UK are the main importers. Only 13 per cent of EU production is exported to third countries. The share of third-country exports is high for onions: Russia has long been the most important export destination outside the EU, but this changed after the import ban in August 2014. Belarus, Senegal and Brazil were the most important third-country destinations recently, with mainly onions exported to the latter two.
Fruit tends also to be traded mostly within the EU itself. However, the share of imports from third countries is significantly higher than it is for vegetables. In fact, around 40 per cent of fruit imports come from countries outside the EU - the main sources being Costa Rica, Colombia, Ecuador and South Africa. Within the EU, Spain, the Netherlands and Italy are the most important origins. Bananas lead in terms of import volume, followed by oranges and apples. Exports to countries outside the EU account for about 16 per cent of total export volumes. The main destinations for fruit from the EU are Germany, France and the UK. The most important third country is Belarus.

## BELCIUM

Unemploymen 4.2 per cent

CPI for Food (2015=100)
(2040
as much fruit as vegetables. In both cases, it is a net im porter. It also imports typical vegetable crops like peas, beans and cauliflower from neighbouring countries for processing.

While apple production is dominated by the varieties Jonagold and Jonagored, the main pear variety is Conference. Once exotic fruits are excluded, pears lead the Belgian fruit export trade. Because of the Russian embargo, new markets outside Europe have been opened: Conference pears are now exported to China, India, Brazil and Vietnam, for example. A large part of Belgium's fruit and vegetable production is marketed through auctions known as Veilingen
According to the Association of Belgian Horticultural Cooperatives (VBT), its members' turnover amounted to $€ 944.1 \mathrm{~m}$ in 2017 - with vegetables accounting for 63 per cent and fruit 37 per cent. Based on sales volume, tomatoes led the way ahead of pears and cucumbers. In terms of value, tomatoes, strawberries and pears were the top performers in recent years.

Belgium is also the largest producer of frozen vegetables in Europe. In 2017, production once again rose to one million tonnes, accounting for a good quarter of total European production. Production is centred around south and west Flanders, and around 90 per cent of production is exported. Important destinations are neighbouring countries like France, Germany and the Netherlands; and recently 87 per cent of exports have ended up in EU markets. For third countries, the US and Australia received the largest quantities

In recent years, Belgium has imported about twice

Although Belgium is only a small country in Europe in terms of area, it is an important hub for European imports and exports, thanks to the seaports in Antwerp and Bruges-Zeebrugge. It's not simply Belgian pears that are shipped via the country; kiwifruit from New Zealand also arrive in Zeebrugge, while many exotic fruits enter exclusively through Belgium on their journey to destinations within Europe. Other arrivals, such as citrus or stonefruit, are destined for domestic consumption

The mainstays of Belgian fruit production are apples and pears. Cultivation of the latter has been extended at the expense of the former in recent years. Currently, pears are grown on 10,000ha and apples on approximately $6,000 h a$. Much of the fruit is produced in Flanders, in the region around Sint-Truiden (Limburg province), while most of the vegetables are grown in Flanders. Important growing regions can be found in Sint-Katelijne-Waver, Roeselare and Hoogstraaten. Tomatoes, leeks, carrots, salads and chicory are important crops produced in Belgium.

## GERMANY

Production of fruit and vegetables in Germany is limited to a certain extent by climate. Although some new greenhouses have been built in recent years, the country continues to rely heavily on imported produce. Where vegetables are grown, they tend to be the classic field products such as carrots, onions or cabbage, plus of course asparagus (mainly white) remains a special feature of Germany's vegetable industry, with almost a quarter of total outdoor vegetable production area dedicated to the crop. Despite a short season of only around three months, and relatively low yields, asparagus makes up a good 3 per cent of the country's vegetable output. In total, around 3.5 m tonnes of vegetables are harvested outdoors in Germany, equal to just under 6 per cent of European production. For asparagus, howev-

er, the country's share is 40 per cent, making it by far the most important producer in Europe and among the leaders worldwide. Germany does still import a significant amount of fresh asparagus, but the marketing window has become smaller and smaller in recent years.
Fruit production in Germany amounts to around 1.3m tonnes in a normal year. However, 2017 was an exceptional year. Massive frosts in April hit the fruit blossom at a delicate stage and nearly halved the apple harvest, which makes up about 75 per cent of the country's entire fruit output. The dry and warm weather in 2018 led to a much larger fruit harvest. In volume terms, strawberries are Germany's second most-important fruit - in recent years, open-field cultivation has been reduced and protected production increased to safeguard supply - with plums, pears and cherries following in terms of importance. Germany's berry production is growing, but recent growth in the category has been driven mainly by imports. Only blueberry production shows a clear upward trend.

Germany relies heavily on fresh fruit and vegetable imports. All exotic fruits, citrus, melons and grapes, as well as large volumes of stonefruit, have to be imported. Vegetable imports consist predominantly of vegetables like tomatoes, peppers and aubergines, but outside the German growing season a large range of salads and other outdoor vegetables are imported. Germany is about 38 per cent self-sufficient on vegetables, but only about 15 per cent on fruit. Fruit imports were at a record high in 2017, but a slight was expected for 2018. Vegetable imports reached their record level in 2016 and decreased slightly in the last two years. Some products are also exported, but the trade balance is definitely negative in both cases.

More than half of all fresh fruit and vegetables are bought in discount stores in Germany. Traditional outlets such as greengrocers, street markets and producers account for only 10 per cent of the purchased volume. For some products like asparagus or strawberries, however, direct sales from producers are very important.

by high tunnels. Other important open-field crops are onions and leafy vegetables.

Fruit production in Greece has remained stable or even increased slightly after 2007. Citrus is the most important sector, but there is more focus on oranges compared with other Mediterranean suppliers, with only limited production of lemons and easy peelers. Melons in Greece are mainly watermelons. They are produced and consumed in huge amounts; they are also the most important export item, in volume terms. The hot summer of 2018 in central Europe has promoted watermelon exports. Stonefruit is another important category, production of which is situated mainly in Macedonia. While clingstone peach production for processing is fluctuating a lot and decreasing, production of peaches and apricots for the fresh market is stable and nectarine production is rising. All of the country's stonefruit products, including cherries, are exported in major quantities. Although its main competitors in the Mediterranean region had a smaller stonefruit crop in 2018, Greece could not increase its exports. Cherries suffered most from heavy rainfall in June. Grapes are also a major export crop, where production has shifted to seedless varieties. Kiwifruit is the star among Greek fruit exports; in Autumn 2018 exports started only slowly, since Southern Hemisphere imports were still present in the European Markets.

Greek exporters have tried in recent years to diversify the destinations of their exports. The fruit exporters have been more successful than the vegetable exporters, with 23 per cent of all fruit exports destined for countries outside the EU. Egypt, Turkey, Jordan and Saudi Arabia have more than doubled their fruit imports from Greece since 2013, but in 2017 and 2018 this trend did not continue; instead, the EU's share of exports increased again. Exports of fresh vegetables are increasingly heading for countries like Bulgaria and Romania, with shipments to Germany down slightly. The latter's demand for imported white asparagus has fallen to such an extent that it has all but disappeared from German supermarket shelves, although Greek cucumbers have retained a stable market share in the south

of the greenhouse area used for vegetables is occupied

1) Excluding products grown for processing

Sources: AMI-informiert.de; CSO; Europech; Eurostat; WAPA

Greece enjoys a special relationship with many countries in the surrounding region, partly because of the high direct investment of Greek companies in those neighbouring countries, and partly because of the region's importance as a market for Greek exports.

Fruit production is more important than vegetable production and Fruit production is also more export oriented. Greek vegetable production has declined over the last decade, although this was mostly due to a decrease in tomato production for processing. Most of the fruit vegetables, like tomatoes, cucumbers, courgettes and peppers, are grown under protection. Crete is Greece's leading region for greenhouse production, followed by the Peloponnese, Macedonia, Thessaly, Central Greece, Epirus and the Aegean Islands. A significant proportion

## NETHERLANDS

The Netherlands might be among the EU's smaller countries, but its long coastline on the North Sea mean it punches above its weight as an important trading hub for fruit imports and exports. Its production might be relatively modest, but it exported a huge amount of fresh fruit in 2017, second only to Spain among EU countries. At the same time, a lot of fruit reaches Europe from overseas via Dutch ports. Bananas are the leading fruit import in volume terms, as well as the most important fruit export. Oranges, table grapes, pineapples and avocados make up the top five imports, while the other leading exports are pears, pineapples, table grapes and oranges.

Less than 10 per cent of all Dutch fruit exports are produced in the country itself. Around 85 per cent of domestic production is pears and apples, and like many other European countries the Netherlands saw its out-

put limited in 2017 before recovering in 2018. Open-field production of strawberries has diminished slightly in recent years, while protected crop volumes have grown. The country's main fruit exports are pears, apples and strawberries, but with a rather limited export basket the trade balance for fresh fruit was negative for a long time. In 2016 and 2017 the trade balance was positive but that was expected to change back in 2018.

The situation in the Dutch vegetable market is different. With imports limited and production and exports of fresh vegetables high, the trade balance is obviously positive. Onions are the largest in terms of production and export volumes (the Netherlands is the secondlargest exporter worldwide), with both cultivated area and export sales showing an upward trend. Due to the dry summer of 2018, onion production nearly halved and prices were at a record high by the end of the year. Export destinations are widespread, with a focus on Senegal and other African countries.

In addition to its huge onion production, the Netherlands is an important producer of glasshouse vegetables. This industry is dominated by tomatoes, production of which has been stable recently with a tendency towards more Roma-type varieties on the vine and snack tomatoes. The use of artificial light is gaining importance when it comes to growing premium tomatoes in winter Planted area for cucumbers has decreased in the last few years, but there is a growing trend in the production of sweet peppers.

Germany is the main export destination for Dutch vegetables - about 46 per cent of all tomato exports went to Germany in 2017 - followed by the UK. For cucumbers, Germany has an even stronger share of 63 per ent. Traditionally, cabbage and carrots were important Dutch exports, normally heading for Germany and eastern Europe. But with increasing production in those countries and greater investment in storage capacity, these export trades are becoming more limited.

## POLAND

Every fourth apple produced in the EU comes from Poland, a statistic that puts it ahead of Italy and France as Europe's top apple-producing country. It also occupies a leading position for other fruit and vegetable crops like sour cherries, carrots and cabbage, and just outranks the Netherlands on mushrooms. But processing plays a major role in Poland's fruit and vegetable sector, as does the notable wild production of items like Chanterelle mushrooms and blueberries.

Apples account for 79 per cent of total Polish fruit production, with the largest concentration of orchards found in Grójec, around 40 km south of Warsaw. Its main varieties are Idared, Shampion, Golden Delicious and Gala. Until Russia banned EU fruit imports in 2014, it was traditionally the main consumer of Polish apples,

taking half of its neighbour's exports. With the market's closure, the flow of exports changed dramatically, for example bringing European and Arab countries suddenly into focus. In 2018/19, large stocks in the east of Europe are causing concern. Polish apples are present in almost all EU markets and are exerting pressure on prices.

For vegetables, Poland's output is very much focused on cabbage, carrots, onions and beetroot, vegetables that are very often used in traditional eastern European cuisine. In terms of exports, however, mushrooms are number one: most are exported to Western Europe, including speciality items like oyster mushrooms and shiitake. For cabbage, on the other hand, the main destinations are countries in south-east and eastern Europe, often those with historical connections to Poland. While Poland is a net importer of fruit, for vegetables it is usually a net exporter. However, imports have recently outstripped exports due to smaller harvests. Fruit imports consist mainly of items that cannot be grown in Poland, such as bananas, citrus and exotic fruits.

Behind Belgium, Poland is the second-largest producer of frozen vegetables in Europe. According to the Institute of Agricultural and Food Economics, its production amounted to 750,000 tonnes in 2017, just over half of all processed vegetables. The canned vegetable and tomato processing industries are also important. For fruit, one of Poland's strengths is the production of juice, nectar and fruit juice drinks. Poland is also the world's leading producer of blackcurrants, which are also used for juice.

Another mainstay is the production of frozen fruit and juice concentrate. In these two cases, Poland occupies a leading position in Europe. Apples especially are used to make juice and concentrate. For frozen fruit, strawberries, sour cherries and raspberries are the biggest items.

## NORDIC COUNTRIES

## DENMARK, FINLAND, SWEDEN

The climate in Sweden, Finland and Denmark precludes these countries from producing a lot of fruit and vegetables, so with their high consumer purchasing power they are particularly popular export destinations. That's especially true in Finland, where the domestic growing season is short due to the cold winters. Although Sweden and Denmark benefit from the warming Gulf Stream in winter, their summer months are only moderately warm. Thus, the three Nordic countries produce a combined vegetable volume of under 950,000 tonnes, equal to only 1.5 per cent of total European production.

The region's most significant vegetable crops are carrots, onions and cabbage, all grown in open field, and tomatoes, which are the leading crop under greenhouse cultivation. Of the three countries, Sweden has retained its position as the largest vegetable producer

in recent years, but since 2012 Denmark's own vegetable production has shown an upward trend, mainly due to increased volumes of onions and carrots. In particular, it has been producing more snack and organic carrots for the European market

At around 120,000 tonnes, the three Nordic countries' fruit production is much lower than their vegetable output. While apples and strawberries are the most important fruits produced, low domestic production means the countries rely heavily on imports and only export very small quantities of fruit, as is also the case for vegetables. Their self-sufficiency is only around 9 per cent for fruit, compared with around 62 per cent for vegetables. The foreign trade balance is very negative for both fruit and vegetables.
Overall, the trio imports about 660,000 tonnes of fresh vegetables per year, with a slight upward trend. The leading imports are tomatoes, salads and cucumbers, with volumes offset by exports of around 90,000 tonnes. Sweden imports the largest volume and has the highest domestic consumption of the three. However, it also has the largest population. Its per-capita vegetable consumption is around 50 kg , compared with 70 kg in Finland and 78 kg in Denmark. The latter is the leading exporter of vegetables, with carrots accounting for more than half of the export volume. In recent years, carrot exports have risen sharply.

With a total of around 1.37 m tonnes, fruit imports are significantly higher than vegetable imports. By far the biggest imported product are bananas, followed by apples for the fresh market and oranges. In the long term, white currants, raspberries and blackberries are among the most important imports, buoyed by growth in the Scandinavian berry market. Imports were offset by exports of just over 80,000 tonnes in recent years. The last two years showed an increase in fruit exports. Domestic per-capita fruit consumption is more similar across the three countries than it is for vegetables. In Sweden, it stands at around 70kg, in Denmark 68kg and in Finland almost 64 kg .

## SPAIN

Spain is still by far the largest producer of fruit and vegetables in Europe. With a broad range of climates, Spain produces a wide range of fruit and vegetables from almost all climate zones. Its export-oriented production is concentrated in the eastern and southern parts of the country bordering the Mediterranean Sea.

Spain is also Europe's leading exporter of fresh fruit and vegetables, as well as one of its most dynamic. In the last decade, its fruit and vegetable exports grew by an annual average of 4 per cent, with vegetables slightly outperforming fruit. Growth rates were especially high for berries, watermelons and kiwifruit. Persimmons, known locally as kaki, were also a great success, but figures are only available for the last six years. Spain has also performed well exporting stonefruit: its success

Sources: AMI-informiert.de; DGA; Eurostat; Fepex; Mapama; WAPA
with peaches (rising 8 per cent per annum) is mainly due to growing exports of flat varieties, which have gained a significant market share in central Europe.

The highest relative growth rates in vegetable exports are found in some minor items like spinach or leeks, but the highest absolute growth rates can be observed in fruit vegetables like peppers, cucumbers and courgettes and in leafy salads and brassicas. Exports of the latter were mainly broccoli, while iceberg lettuce is still the most exported salad vegetable crop; growth in this category was due to the success of other articles like baby leaf or romaine hearts. Even exports of traditional items like the typical, large-sized Spanish onions grew by almost 14,000 tonnes per year in the period from 2008 to 2017.
In 2018, exports of fresh fruit have decreased according to preliminary data. A smaller harvest of peaches and nectarines was partly responsible, while a rather cool spring led to limited availability of strawberries and early melons. The hot and long summer in central Europe prompted record exports of watermelons, however. Exports of fresh vegetables increased after a dip in 2017, which was caused by low temperatures. Pepper and cucumber exports will probably reach record levels.

Spanish exports go mostly to other EU countries, with only 7 per cent sent to third countries. Germany ( 26 per cent) is the most important destination, followed by France ( 18 per cent), the UK ( 12 per cent), the Netherlands (8 per cent, often re-exported) and Italy (6 per cent).

Spanish imports, meanwhile, are growing but still of limited importance compared with exports. Offering high per-capita consumption, the domestic market is also an interesting destination for Spanish producers. Compared with Germany, private households in Spain buy double the quantity of fresh fruit and vegetables. According to panel data published by the Spanish Agricultural Ministry, Spanish households are buying slightly less fresh fruit, while quantities of fresh vegetables and potatoes remain constant. About 25 per cent of the budget for fresh fruit and vegetables is still spent at traditional shops, mainly greengrocers. These outlets are more important for fruit than for vegetables.

Domestic fruit and vegetable production in the UK is relative small, although it is the EU's eighth-largest producer of vegetables. After a low around 2005, its vegetable production area has recovered to around 125,000ha, of which 35,000 ha are used to grow peas for processing. An additional 33,500 ha are peas harvested dry, which are usually not counted as vegetable area. Protected veg production is insignificant, at just 850ha.

In terms of EU fruit production, the UK sits in twelfth place. Production of apples and pears appears small, with the notable point that the country grows a high proportion of 'culinary apples' (essentially Bramley), which are not consumed raw. The soft fruit sector, in the meantime, is developing very dynamically. Since 2000 , its production has more than doubled, and for the

1) Including products grown for processing. 2) Excluding potatoes.
most part is now essentially protected cultivation under plastic tunnels. Overall growth in Glasshouse fruit (140ha in 2006, 217ha in 2017) has outpaced glasshouse vegetables (700ha in 2006, 850 ha in 2017).

The 2018 season was characterised by below-average temperatures in February and March and very high rainfall in March, April and May, making it difficult to plant field crops in time. In June and July there was practically no recorded rain, and precipitation in August was still below average. Southern parts of the UK, along with Belgium and southern Netherlands, were among Europe's driest regions in the hot summer of 2018. Frequent irrigation could not safeguard all crops, with high temperatures promoting plant diseases and stress to field crops. This resulted in below-average yields across the board.

Due to its relatively small domestic production, the UK is one of Europe's largest importers of fresh fruit and vegetables, ranking second in the EU for both. Twothirds of its fresh vegetables come from Spain and the Netherlands, with only 12 per cent from third countries. Last year's small domestic crop was compensated in part by more imports from those two sources.

By contrast, almost two-thirds of its fruit come from third countries - in addition to the traditional banana suppliers of south and central America, South Africa (9 per cent) plays a prominent role. The most important EU source is Spain (16 per cent). As imports have climbed year on year, the UK's self-sufficiency rate for fruit has fallen to 16 per cent, while for vegetables it is higher at 53 per cent. The degree of self-sufficiency in 2018 is likely to be even lower.

Brexit is a point of constant discussion in the UK and on the Continent. But, since the exact new rules of trade after March 2019 are still not known, the effects remain difficult to predict. Massive changes of trade flows are unlikely, but bureaucratic obstacles may turn out to be a real problem.

The UK's fresh fruit and vegetable exports are minor, although in the past five years re-exports of items including bananas and oranges have risen. In 2017, UK household spending on fresh fruit and vegetables (including fresh-cut, excluding potatoes) was the second highest in the EU at $€ 13.2 b n$, just behind Germany (€14.8bn).

## DISCOUNT RETAILING IN EUROPE

While it is by no means clear if the world's first discount store was in Germany, the country can certainly claim to have achieved the greatest economic success in discount retailing - something that holds true in their home market as well as in neighbouring European countries. In 1962, the Albrecht brothers opened their first Aldi supermarket, in Essen, featuring a characteristically limited number of products, self service directly from pallets or cartons, and constantly low prices - the latter made possible by extremely efficient logistics along the whole supply chain. Until the early 1990s, Aldi's cash registers did not have scanners, apparently because they were too slow. Every cashier knew the price of the 600 articles by heart.

In the sixties and seventies, discounters did not sell any fresh produce at all. Only in the early eighties did the first fruit and vegetables appear, starting with bananas and cucumbers. Nowadays most discounters even manage to overtrade in fresh produce. In countries where discounters had a high market share, like Austria and Germany, the high turnover rate was an advantage when it came to produce. Since there were no coldstorage facilities in these countries' supermarkets, the quality of produce sold through discounters was sometimes better, although that advantage disappeared when the conventional chains began investing in such technology

With a turnover of $€ 81$ bn in 2017 (according to LZ Retailytics), Lidl is Europe's leading discounte That's because, despite being number two in its home market Germany, it invested earlier and faste than the country's biggest discounter Aldi in other European countries. Still far ahead of their competitors, the two companies remain undisputed leaders at the top of Europe's discount ranking. Aldi's European turnover is estimated at €62bn. Which means it's only from third place down that the rankings tend to change: Russian retailer X5 Retail Group (Pyaterochka) recently overtook Edeka Group's discount banners (mainly Netto Marken Discount), pushing it into fourth place. While the leading German discounters already have a strong foothold and high share in western European markets - the UK being a notable exception - but the Russian newcome (estimated turnover €18bn) has almost unlimited opportunities to expand in the east.

Number five in the European rankin is Penny, the discount division of German supermarket chain Rewe. Number six is Poland's Biedronka, a subsidiary of Portuguese retailer Jerónimo Martins. Places seven and eight are occupied by Scandinavian companies Rema 100 and Dansk Supermarked (with its main format Netto). Southern European companies Eurospin (Italy) and Dia Market (Spain) respectively make up the last two places in the top ten.

The level and development of discount market share in fast-moving consumer goods (FMCG) varies greatly from country to country. The highest market share in Europe, with more than 60 per cent of expenditure on FMCG, is in Norway, but within the EU the leaders are Denmark and Germany. In the UK and France, which are at the lower end of the FMCG ranking, the trends are completely different. Discounting in the UK is still growing rapidly, but the market share of discounters in France has decreased slightly in the last two years. Some eastern European countries like Croatia and Bulgaria

## EXPENDITURES FOR FMCGH (\% 2017)

are also at the lower end of the scale. Spain, meanwhile was the country with the lowest discount share of FMCG in the EU in 2017, albeit growing rapidly; Spanish consumers still buy a lot of produce at street markets or at traditional shops, something that is also true to a lesser degree in Italy.

In most countries for which we have data, discount ers are overtrading in freshproduce, Italy being the only exception. Many discounters use fresh fruit and vegetables to attract customers into their stores, and because perishable products have to be bought more frequently than other foods, the fruit and vegetable department is strategically important.

What's more, discounters' share of fresh fruit and vegetable spending has grown ever since the category was introduced, but this growth differs according to segment and country. In Germany in 1986, just five years after discounters started selling produce, the percentage of leafy vegetables sold there was already 14 per cent. Six years later, in 1992, that figure was 24 per cent; in 2017 it reached 52 per cent. In the past four years, volume growth in leafy vegetables has stopped, but expendi tures have kept rising - partly due to a real price increase but mainly thanks to shoppers trading up. The comparatively cheap iceberg lettuce, for example, accounted for 37 per cent of category spending at discount in 2012, but only 31 per cent in 2017. At the same time, high-priced items like rocket and lambs lettuce increased their share - a trend seen not only in the discount sphere but also other trade channels including supermarkets.

Discounters are growing fastest in the UK. Although the German chains have been active there for a long time, they only really began to take off 15 years ago. For a very long time, conventional wisdom suggested a pronounced class consciousness would stop British consumers buying from discount stores. But with new product ranges and a refreshed image - focused on

smart, rather than stingy, shoppers - sales started to grow. Fresh produce has played an important role in this success story: Aldi and Lidl recently overtraded in several categories including potatoes, soft fruit, citrus, fresh-cut salads and leafy vegetables.

France is a noteworthy exception. There, discount's share of fresh fruit and vegetable sales peaked around 2010 at around 11 per cent. Supermarkets specialising in fruit and vegetables have emerged as strong competition to both the hypermarkets and the discounters. By

presenting a huge range of fresh produce at competitive prices, these formats have attracted consumers and kept a lid on the discounters
market share.
When it comes to product mix, the difference between discounters and supermarkets is not as pronounced as one might think. Even rather sensitive segments, like fresh-cut salads, are well represented in discount stores. In Germany, the UK and Spain, they are even overtraded by discounters, and even in France fresh-cut salad sales are trading at 70 per cent relative to the fruit and vegetable category. Organic produce is present too, with discounters overtrading in major organic lines such as bananas and carrots, although a limited portfolio of products means this does not hold true for the whole organic category

Bananas generate the biggest discount sales, something that's also true in southern Europe. In the vegetable segment, carrots, tomatoes and cucumbers have a high discount share. The same could be said of potatoes if the organised retail sector were taken into account. But in countries like Germany or Austria, direct sales from producer to consumer still command a certain importance, lowering the market share of discounters and supermarkets.

It is difficult to calculate the real difference in term of consumer prices between discounters and supermarkets, because each trade channel's specifications are usually slightly different. Discounters benefit from a relative price advantage, and the perceived difference

| Tomatoes | 56.8 | 18.9 | 11.2 |

is higher in an undersupplied market where average prices are high than it is in an oversupplied market with depressed prices. Consequently, in Germany the discounters have gained more market share during years when prices were higher. Preliminary data for 2018 show an increase of discount market share in fresh vegetables and a decrease in fresh fruit. In Italy and Spain, discount share has reportedly grown again in the first half of 2018.

However, low prices alone are no longer a guarantee of success. One leading discounter was forced to learn this lesson the hard way, because a lack of innovation drove away the next generation of young consumers. Ranges have to be monitored and renewed constantly. The number of fresh produce lines has grown quickly in the last few years, but of course this growth has its limits, because the advantage of efficient logistics depend on a limited number of lines. In the end, a discount store still has to offer low prices.
